ANALYZER

TEAMQUEST ANALYZER®

Identify and analyze real-time and historical IT performance issues

WHAT IT IS

TeamQuest Analyzer is a performance management solution that provides real-time and historical views of performance across heterogeneous virtualized & physical environments. Analyzer helps ensure service availability, providing early warning of potential bottlenecks and the ability to drill down into details to identify the root cause and correct the problem before it affects users.

WHY IT MATTERS

- Enables fast root-cause identification & resolution, seamlessly taking the user from symptoms to the details needed for diagnosis.
- Reduces training/staffing needs, by providing a common tool for heterogeneous environments.
- Enables analysis from a business point of view, processing business metrics together with related IT infrastructure measurements.
- Detects problems before they impact services, by proactively monitoring all IT infrastructure and applications.
- Ensures availability and allows organizations to consistently meet IT SLAs, reporting on service performance & capacity in real time.

Analyze real-time and historical performance of IT infrastructure and applications

Identify the root cause of performance issues

Use a single tool across heterogeneous physical and virtual environments

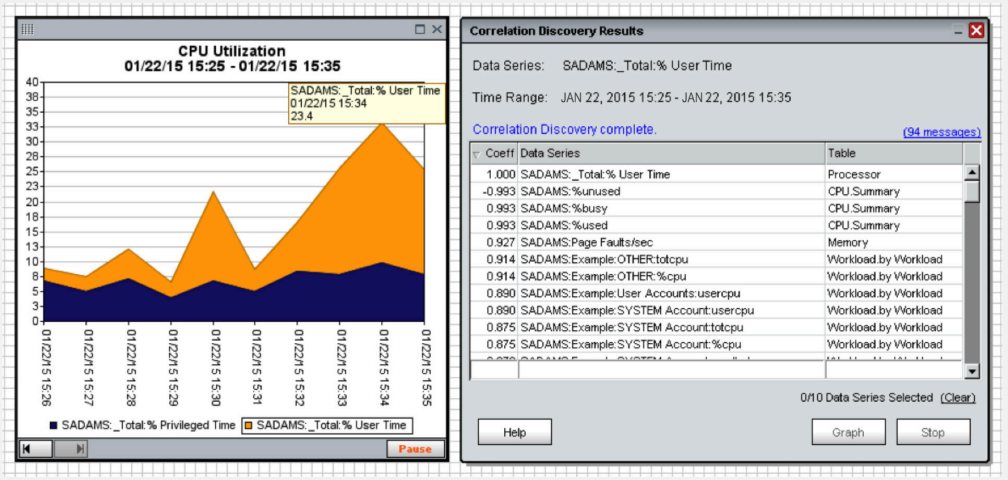
HOW IT'S BETTER

- Works in conjunction with TeamQuest CMIS, a powerful platform for data collection, data management, automated analytics, and monitoring.
- Gives industry-leading, accurate analysis of resource utilization, showing the consumption by IT and business services with precision.
- Sees the big picture and the details, with high-level dashboards drilling down to fine-grained, process-level details.
- Analyzes real-time performance of everything, providing a tool that can cross IT technology and application/service silos.
- Enables standardized IT Service Optimization, delivering consistent data & analysis throughout the organization.

KEY CAPABILITIES

- Identify the IT component causing a problem, regardless of where that component may reside.
- Automatically identify impending problems before they affect business.
- Compare actual performance to service levels in real time.
- Identify cycles and patterns in system behavior using trend analysis.
- Determine how much of each resource is being consumed by each IT service, business process, department, or application.
- Customize the view of the IT infrastructure, such as by tier, by platforms, by hypervisor and guests, by location, or in terms of the IT services they support.
- Monitor the health of services automatically.



TeamQuest Correlation Discovery Analysis helps users find the root cause of performance problems. This feature automatically searches for performance parameters that are related to a symptom being observed, whether that symptom has to do with business performance or technical performance of a service or application.
