

CMIS

TEAMQUEST CMIS®

Collect, store, and manage performance data

WHAT IT IS

TeamQuest CMIS (capacity management information system) provides vendor-agnostic performance data management for physical servers, virtual servers, cloud instances, and storage systems, efficiently facilitating drill down from high-level dashboards into detailed data.

WHY IT MATTERS

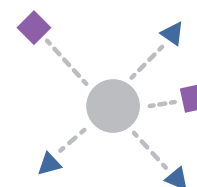

- Collects and stores performance data through all infrastructure tiers, from services and applications to underlying storage systems.
- Frees staffing resources from the need to maintain multiple, disparate data repositories by providing one virtual performance database with everything.
- Reduces time to resolve cross-silo problems with vendor-agnostic solution for physical servers, virtual servers, cloud instances and storage systems.
- Efficiently facilitates drill-down from high-level business dashboards to detailed data.
- Reliably and accurately measures application performance in real-time with extremely low overhead
- Determines what portion of each IT resource is contributing to each business or IT service for financial analysis

Gather data from applications, servers, and storage

Efficiently retain data at various granularities

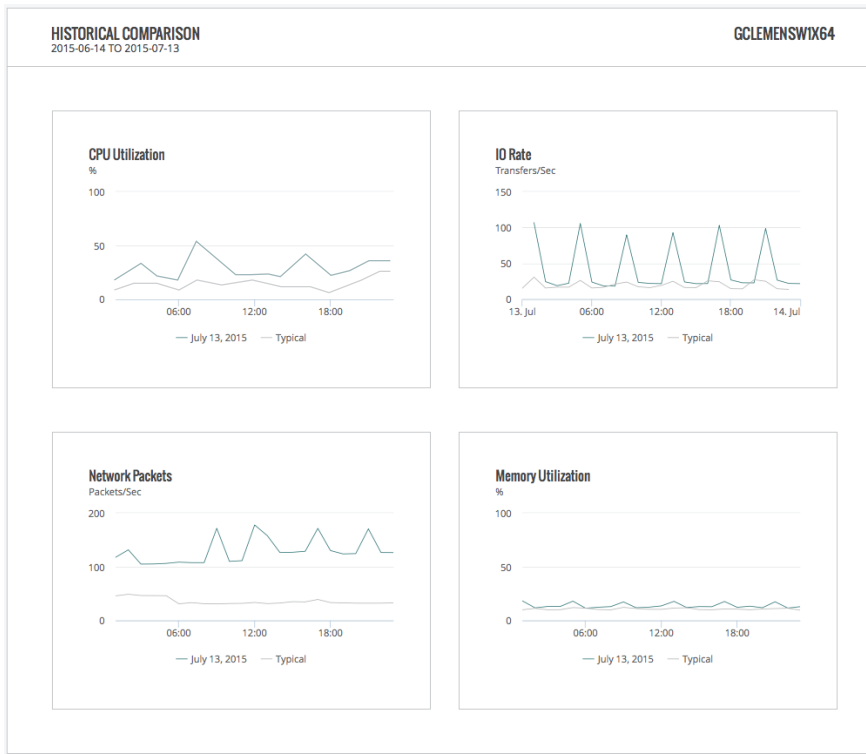

Use flexible agent and agentless data collection, reduction, and aggregation

HOW IT'S BETTER

- Efficiently gathers data from a variety of infrastructure using out-of-the-box collectors for applications, middleware, databases, OS's, hypervisors, storage systems and more.
- Efficiently stores all the data needed using a distributed architecture.
- Can collect data in increments as short as one second.
- Provides seamless and automated access to data, quickly fetching the details needed regardless of where they are stored.
- Selectively aggregates and summarizes; does not force you to throw away important data to get enterprise reporting.
- Automates sophisticated analysis functions, enabling powerful and highly scalable analytics.
- Permits both agent and agentless collection.

KEY CAPABILITIES

- Efficiently collects data from a variety of sources and stores in a distributed performance database.
- Allows for creation of "user agents" for gathering virtually any type of performance data, including information about business performance, custom applications, power consumption or cooling.
- Integrates tightly with other TeamQuest products (TeamQuest Analyzer, TeamQuest Surveyor, and TeamQuest Predictor).

This report shows typical against actual for CPU, memory, I/O, and network utilization. This report uses TeamQuest CMIS and is available from both TeamQuest Surveyor and TeamQuest Analyzer.
