

TeamQuest Baseline for Clear Path OS 2200 Systems

Pinpoint Problem Areas
With Ease

TeamQuest Baseline (Baseline) reports on computer system performance and locates performance bottlenecks. With it you can analyze the present and the past, from one to multiple systems, and from high-level information to detailed component and user activity. Baseline allows you to manage multiple systems from a variety of platforms from a single work station.

Baseline collects and displays system resource information for hardware components and software applications in concise, understandable charts and tables. It offers four levels of analysis, including threshold analysis, drill-down analysis, correlation analysis, and trend analysis.

TeamQuest Baseline gives you the ability to observe and manage the performance of your systems:

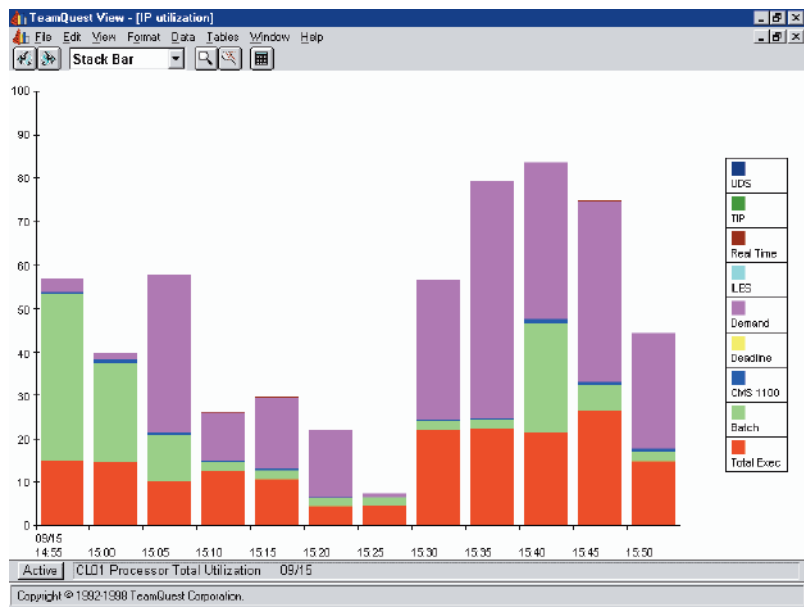

- Inspect and ensure service level objectives
- Maintain a record of system and software usage
- Identify who or what is causing system slowdowns
- Measure new application impact
- Manage multiple systems by exception
- Integrate business metrics with performance data

Note: the data-collector for Baseline gathers statistics on CPU utilization, I/O usage, memory usage, disk space utilization, SUPs utilization, MAPPER applications, DCP utilization, TIP usage, network file system, TCP/IP, Sybase and Oracle database applications (UNIX systems only), and any application that is instrumented to collect performance-related statistics. The data collector is integrated with management consoles, including HP OpenView, IBM NetView/6000, SunNet Manager, and Tivoli/Enterprise Console.

The TeamQuest Clear Path OS 2200 Series Software family includes products in several categories:

Performance Analysis and Capacity Planning • Modeling • System Management • Tools and Utilities

TeamQuest Baseline lets you analyze overall system utilization (left), process detail, and active users.

Built-In Analysis

- Adaptable Threshold Analysis continuously monitors vital system indicators and alerts you when conditions require your attention
- Drill-Down Analysis guides you from any point on a graph down to the users and processes active at that particular time
- As you explore cause-and-effect relationships, Correlation Analysis uncovers patterns within the activity of users and components
- Trend Analysis lets you use historical data as your guide to the present, helping you find cycles in system behavior

Flexible Interface

- Combined data from the resources being used and the applications using them into a single source for information, investigation and reporting
- Collect data from a variety of platforms and display the information on a single console or multiple workstations
- Manage your entire enterprise from the desktop of your choice
- Adjust the user interface to depict the information the way you want to see it
- View side-by-side comparisons of before and after activity seamlessly in charts and graphs

Application Visibility

- Maintain a compact historical record of system performance behavior and application components
- Configure your workload characteristics to collect information by business application
- Add your own mission critical statistics unique to your system to the TeamQuest performance database to monitor and analyze along with all other statistics

Past and Present Reporting

- Receive early warning of potential problems with user-defined thresholds and alarms
- Observe alarm states within Baseline or publish them to management consoles with SNMP traps
- Click on any time point in a chart and drill down to the user and process activity taking place at that time
- Collect statistics at the system, workload, resource, and process levels to give a comprehensive view of system performance
