

TeamQuest PMPlus for Unisys MCP Systems

Manage All Aspects of Your
MCP Environment

TeamQuest PMPlus(PMPlus) bundles performance management software for Unisys MCP systems and UNIX/NT machines, giving you total control of your ClearPath configuration. This cross-platform solution combines three software packages, including TeamQuest SMFII and TeamQuest Probes (Probes) for Unisys MCP and TeamQuest View (View) for UNIX and NT. Together these products provide a comprehensive solution unique to your ClearPath environment.

TeamQuest SMFII and TeamQuest View are similar products that report on system behavior and locate performance bottlenecks. With these products, you can analyze the present and the past, from one to multiple servers, and from high-level information to detailed component and user activity. You can analyze performance data on Unisys MCP Systems, UNIX, and NT systems with a single interface. The Probes product supplies performance data targeted for the Unisys MCP System component from unique sources, such as database servers, communication subsystems and application components.

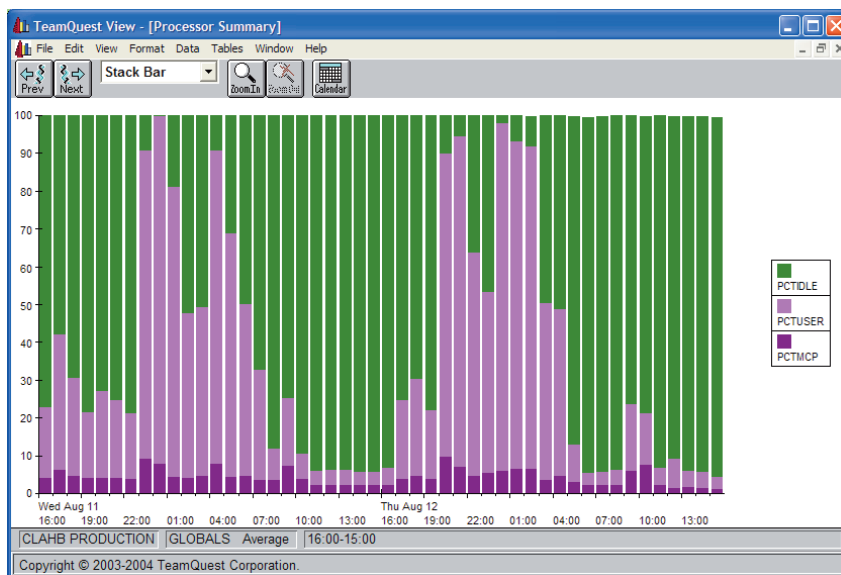

TeamQuest PMPlus delivers information on all aspects of your ClearPath system:

- Inspect and ensure service level objectives
- Identify who or what is causing system slowdowns
- Measure new application impact
- Track hardware configurations

Note: The data collectors for PMPlus gather statistics on system-wide CPU utilization, memory usage, I/O usage, disk space utilization, tasks, NAP, COMS, DMSII, LINC, BNAV2 and any application that is instrumented to collect performance-related statistics.

The TeamQuest Unisys MCP Systems Software family includes: TeamQuest Model, TeamQuest SMFII, TeamQuest Probes, TeamQuest Extended NAP Probes, TeamQuest PMPlus, and TeamQuest Express.

TeamQuest PMPlus lets you analyze interaction ranging from overall CPU utilization (right) to task details.

Built-In Analysis

- Drill-Down Analysis guides you from any point on a graph down to the users and processes active at that particular time
- As you explore cause-and-effect relationships, Correlation Analysis uncovers patterns within the activity of users and components
- Trend Analysis lets you use historical data as your guide to the present, helping you find cycles in system behavior
- Exception Management uses a combination of automated and visual thresholds to alert you to potential problems before they become critical

Flexible Interface

- Combine data from the resources being used and the applications using them into a single source for information, investigation and reporting
- Analyze performance data on Unisys MCP Systems, UNIX, and NT systems with a single interface
- Adjust the user interface to depict the information the way you want to see it
- View side-by-side comparisons of before and after activity seamlessly in charts and graphs

Application Visibility

- Maintain a compact historical record of system performance behavior and application components
- Configure your workload characteristics to collect information by business application
- Add your own mission critical statistics unique to your system to the TeamQuest performance database to monitor and analyze along with all other statistics

Past and Present Reporting

- See changes in CPU usage, memory usage, and I/O usage as it happens
- Tailor performance reports to meet your unique needs
- Report on system activity grouped by common characteristic, such as by usercode, job name, or task name
- Click on any time point in a chart and drill down to the user and process activity taking place at that time
- Collect statistics at the system, workload, resource, and process levels to give a comprehensive view of system performance
